

1. What is the key difference between publishing a dashboard on Tableau Public versus Tableau Server/ Cloud in terms of accessibility and data security ?

Ans:-

Feature	Tableau Public	Tableau Server / Tableau Cloud
Accessibility	Open to everyone on the internet	Restricted to authorized users (login required)
User Access	No login needed	Login and authentication required
Sharing	Public sharing via link	Controlled sharing within organization
Data Security	No security (data is public)	High security (data is protected)
Data Privacy	Data can be downloaded by anyone	Data access is restricted based on permissions
Use Case	Portfolio, learning, public projects	Business, organizations, confidential data
Control	No control over who views data	Full control (role-based access, permissions)

2. When publishing a Tableau dashboard, what happens to a live connection compared to an extract? How does this affect data refresh and performance?

Ans:-

Live Connection

- When published, the dashboard stays connected to the original database
- Data is fetched in real-time whenever the dashboard is opened or used
- No need for manual refresh (always up-to-date)
- Performance may be slow because it depends on:
 - Database speed
 - Network connection
 - Query complexity

Extract

- When published, Tableau uses a stored snapshot of data (Hyper extract)
- Data is not updated automatically
- Requires manual or scheduled refresh
- Faster performance because data is stored and optimized

Effect on Data Refresh

- **Live Connection:**
 - Data is refreshed automatically in real time
 - No need to schedule or manually refresh
 - Always shows the latest data from the source
- **Extract:**
 - Data is not updated automatically

- Requires manual refresh or scheduled refresh
- Data can become outdated if refresh is not done

Effect on Performance

- **Live Connection:**
 - **Slower performance**
 - Depends on:
 - Database speed
 - Network connection
 - Query complexity
 - May cause delays while loading dashboards
- **Extract:**
 - Faster performance
 - Data is stored in optimized format (Hyper)
 - Dashboards load quickly and run smoothly

3. In Tableau Server or Cloud (conceptually), which feature allows administrators to control which users can view, interact with, or edit a published dashboard?

Ans:-

Explanation with Reason

- **Permissions** let administrators define what each user or group can do with a dashboard.
- These permissions are assigned based on roles (like Viewer, Explorer, Creator) or specific rules.

What Permissions Control:

- **View** → Who can see the dashboard
- **Interact** → Who can filter, drill down, or explore data
- **Edit** → Who can modify or republish the dashboard
- **Download** → Who can export data or reports

How It Works (Conceptually)

- Admins assign permissions to:
 - Users or Groups
- Permissions are applied at different levels:
 - Project level
 - Workbook/Dashboard level
 - Data source level

4. If you want users to view a dashboard but not download the underlying data, which permission setting would you adjust in Tableau Server?

Ans:-

To allow users to view a dashboard but not download the underlying data, you need to adjust the “Download Data” permission in Tableau Server/Cloud.

Explanation with Reason

- Tableau permissions include options like:
 - View
 - Interact
 - Download Data
 - Download Workbook
- In this case:
 - **Allow:** *View* (so users can see the dashboard)
 - **Deny/Disable:** *Download Data*

This ensures:

- Users can see and interact with the dashboard
- But cannot access or download the raw/underlying data

5. Name two methods by which a Tableau dashboard can be embedded into a web page or website.

Ans:-

Two Methods to Embed a Tableau Dashboard into a Web Page

1. Embed Code (iFrame)

- Tableau provides an embed code (HTML iFrame) when you publish a dashboard
- You can copy and paste this code into your website’s HTML

Reason:

- Simple and widely used
- Does not require advanced coding
- Works on most websites

2. Tableau JavaScript API (Embedding API)

- Use Tableau’s JavaScript API to embed dashboards programmatically
- Allows more control and customization

Reason:

- Enables interactivity (filters, events, dynamic updates)
- Useful for advanced web applications

6. List two best practices you should follow when preparing a dashboard for public sharing to ensure data security and privacy.

Ans:-

Two Best Practices for Data Security & Privacy

1. Remove or Anonymize Sensitive Data

- Do not include personal or confidential information (e.g., names, phone numbers, patient IDs)
- Replace with aggregated or anonymized data

Reason:

Prevents exposure of private or sensitive information when the dashboard is publicly accessible.

2. Disable Data Download Options

- Turn off “Download Data” and “Download Workbook” permissions

Reason:

Stops users from accessing or extracting the underlying dataset.

**7. After publishing a dashboard, users report a “Data not found” error.
What is the most common cause related to data source settings?**

Ans:-

The most common cause is that the data source path or connection is not properly configured after publishing.

Explanation with Reason

- When a dashboard is created, it may use a local file (like Excel or CSV) or a database connection from your system
- After publishing to Tableau Server/Cloud:
 - The server cannot access local file paths (e.g., C:\Users\...)
 - Or the database connection credentials are missing/incorrect

This results in a “Data not found” error

Common Issues

- File was not uploaded with the workbook
- Broken connection path
- Missing database credentials
- Data source not published or linked correctly

8. When embedding a Tableau dashboard into a secure internal portal, what two additional security measures should be implemented to ensure only authorized users can access the embedded content ?

Ans:-

When embedding a Tableau dashboard into a secure internal portal, the following two security measures should be implemented:

1. User Authentication (Login / SSO)

- Require users to log in before accessing the dashboard
- Can use Single Sign-On (SSO) for seamless and secure access

Reason:

Ensures that only verified users can access the embedded dashboard.

2. Permissions (Role-Based Access Control)

- Set user/group permissions on Tableau Server/Cloud
- Control who can view, interact, or edit the dashboard

Reason:

Restricts access so only authorized users can see or interact with the content.
